

Here's What's New in North Carolina Truck Trends

Data from the Census Bureau's 1997 Vehicle Inventory and Use Survey are now available for North Carolina. This survey produces state and U.S. level statistics on the physical and operational characteristics of the Nation's truck, van, minivan, and sport utility vehicle population.

There were an estimated 1,996,100 private and commercial trucks registered in North Carolina during 1997, up more than 13 percent from the approximately 1,760,000 trucks registered in 1992.

The survey includes these highlights for North Carolina:

The number of sport utility vehicles (SUVs) registered in North Carolina during 1997 increased 78.2 percent from 1992. In comparison, the number of minivans increased 74.7 percent and the number of pickups decreased 2.9 percent during his same period.

- Total truck registrations in 1997 included 51.9 percent pickups, 17.9 percent SUVs, and 12.8 percent minivans.
- North Carolina has approximately one pickup for every 7 people and about one SUV for every 21 people. It also has approximately one pickup for every 5 licensed drivers and about one SUV for every 15 licensed drivers.

- Approximately 4.9 percent of all large trucks carried hazardous materials in 1997.
- About 69.9 percent of all trucks were used for personal transportation, while 29.5 percent were operated for business, including for-hire use.
- Approximately 3.8 percent of all trucks were leased from someone else, compared with 0.6 percent in 1992.

The report also includes information on fuel efficiency, annual and lifetime mileage, model year, equipment accessories and other data for each kind of registered truck.

The U.S. Summary will be issued in late 1999, following the release of reports for the 50 states and the District of Columbia. This survey is conducted every five years as part of the Economic Census and data are used by government agencies, business, industry, academia, and the general public.

The estimates from the 1997 Vehicle Inventory and Use Survey are subject to sampling and nonsampling error. Sources of nonsampling error include errors of response, non-reporting and coverage. Measures of sampling variability, presented as relative standard errors, are shown in the tables in the report.
